

This form should be used for all taxonomic proposals. Please complete all those modules that are applicable (and then delete the unwanted sections). For guidance, see the notes written in blue and the separate document "Help with completing a taxonomic proposal"

Please try to keep related proposals within a single document; you can copy the modules to create more than one genus within a new family, for example.

MODULE 1: **TITLE, AUTHORS, etc**

| | | |
|---|--|------------------------------------|
| Code assigned: | 2016.012aP | (to be completed by ICTV officers) |
| Short title: Two new species in the genus <i>Badnavirus</i> (e.g. 6 new species in the genus <i>Zetavirus</i>) | | |
| Modules attached (modules 1 and 11 are required) | <input type="checkbox"/> 6 <input checked="" type="checkbox"/> 2 <input type="checkbox"/> 3 <input type="checkbox"/> 4 <input type="checkbox"/> 5 <input type="checkbox"/> 7 <input type="checkbox"/> 8 <input type="checkbox"/> 9 <input type="checkbox"/> 10 11 <input checked="" type="checkbox"/> | |

MODULE 2: NEW SPECIES

creating and naming one or more new species.

If more than one, they should be a group of related species belonging to the same genus. All new species must be placed in a higher taxon. This is usually a genus although it is also permissible for species to be “unassigned” within a subfamily or family. Wherever possible, provide sequence accession number(s) for **one** isolate of each new species proposed.

| Code | 2016.012aP | (assigned by ICTV officers) |
|--|--|--------------------------------------|
| To create two new species within: | | |
| Genus: | Badnavirus | |
| Subfamily: | | |
| Family: | Caulimoviridae | |
| Order: | | |
| Name of new species: | Representative isolate: (only 1 per species please) | GenBank sequence accession number(s) |
| <i>Taro bacilliform CH virus</i> | Taro bacilliform CH virus, isolate TaBCHV-1 | KP710178 |
| <i>Yacon necrotic mottle virus</i> | Yacon necrotic mottle virus, isolate YV1 | KM229702 |

Fill in all that apply.

- If the higher taxon has yet to be created (in a later module, below) write “**(new)**” after its proposed name.
- If no genus is specified, enter “**unassigned**” in the genus box.

Reasons to justify the creation and assignment of the new species:

- Explain how the proposed species differ(s) from all existing species.
 - If species demarcation criteria (see module 3) have previously been defined for the genus, **explain how the new species meet these criteria**.
 - If criteria for demarcating species need to be defined (because there will now be more than one species in the genus), please state the proposed criteria.
- Further material in support of this proposal may be presented in the Appendix, **Module 11**

Taro bacilliform CH virus is considered a new badnavirus species for the following reasons:

1. The complete genome sequences of two isolates of *Taro bacilliform CH virus* (TaBCHV) were assembled from deep sequencing reads and from the sequences of overlapping cloned PCR amplification products. These isolates originate from two separate plants showing mild feathery mosaic symptoms on young leaves and brown spots on matured leaves. Both genomes are 7644 bp long. One large ORF (ORF3) encodes a polyprotein harboring domains homologous to the badnavirus movement protein, aspartic protease, reverse transcriptase, ribonuclease H and zinc finger-like RNA binding domain
2. In phylogenetic analysis using ORF3 nucleotide sequences corresponding to the conserved RT/RNaseH, TaBCHV groups within the genus *Badnavirus* (Fig. 1). TaBCHV most closely related badnavirus is Citrus yellow mosaic virus (CiYMV), with both viruses sharing 69.05% identity (Table 1), which is well below the 80% threshold for discrimination of strains and species within the genus *Badnavirus*.

Yacon necrotic mottle virus is considered a new badnavirus species for the following reasons:

1. A complete genome sequence of Yacon necrotic mottle virus (YNMoV) was assembled from deep sequencing of cDNA obtained from yacon plants (*Smallanthus sonchifolius*) showing systemic necrosis, chlorosis, stunting, and leaf malformation symptoms. PCR amplicons covering the entire circular genome were obtained from symptomatic leaves and sequenced by the Sanger method. The 7661 bp genome displays a typical badnavirus genome organization, with a large ORF (ORF3) putatively encoding a polyprotein precursor of 234 kDa containing conserved MP, CP, viral aspartic protease, RTase, and RNase H domains which are analogous to those of other badnaviruses.
2. YNMoV-specific primers were designed and used for screening yacon plants by PCR. Amplification products were obtained from symptomatic plants but not from asymptomatic ones.
3. In phylogenetic analysis using ORF3 nucleotide sequences corresponding to the conserved RT-RNase H domains, YNMoV groups within the genus *Badnavirus* (Fig. 1). YNMoV is a sister taxon of *Bougainvillea spectabilis* chlorotic vein-banding virus (BCVBV), sharing 68.3% nt identity within the RT-RNase H domains (Table 1), which is well below the 80% demarcation threshold for discrimination of species within the genus *Badnavirus*.

MODULE 11: APPENDIX: supporting material

additional material in support of this proposal
